pages behind their closest competitor

9

pages flag fabricated or dishonest data

3.9

average score out of 10

THE STRATEGIC PICTURE

Max Booster's real advantage is breadth, not depth. It is the only product in this review that puts creation, distribution, royalties, marketing, and fan management inside one login — every competitor benchmarked here is a specialist: BeatStars only sells beats, DistroKid only distributes, Chartmetric only analyzes, Patreon only runs memberships. No single Max Booster page outright beats its specialist competitor, but no specialist competitor covers anywhere near this much of an artist's business. That breadth is a real, defensible position — as long as every page inside it can be trusted. Right now, 9 of 29 pages (31%) present a number, label, or "AI" claim that is not actually true. That is a bigger risk to the breadth strategy than any single missing feature: a user who catches one fabricated metric stops trusting every other number on the platform. The immediate priority is not new features — it is making every existing page honestly describe what it does.

TOP 3 PRIORITIES

01

Tell the truth first

Fix the 9 fabricated/dishonest surfaces before anything else — trust erodes faster than features attract.

02

Ship the flagship win

Studio is the one Competitive-rated page (6/10) — it is closest to a genuine "ahead" story worth marketing.

03

Fix the four 2/10s

Merch Store, Advertising, Assistant, and Playlist Pitching each fail at the one job their name promises.

How this benchmark was built

SCOPE

29 core product surfaces were assessed — pages a working artist actually uses to make, sell, distribute, and grow music. Route variants of one page (for example the four storefront URL patterns) were merged into a single entry. Authentication, legal, marketing, admin, and account-settings pages were excluded as out of scope for a feature benchmark.

COMPETITOR SELECTION

For each page, the closest publicly-documented functional equivalent was chosen — not necessarily the company most people would name as "the" competitor. A few pages (Career Coach, Merch Store's true equivalent) have no clean SaaS match, so the nearest realistic alternative is used instead and flagged as such.

RESEARCH BOUNDARY

Every competitor claim is sourced from public marketing pages, help-center docs, pricing pages, or store listings — never from a competitor's non-public source code or internals. Every Max Booster claim is sourced from this codebase's actual, current behavior — not its marketing copy or its intended roadmap.

SCORE (0–10)

How Max Booster's page compares to this specific competitor's equivalent feature — not an absolute industry ceiling. A 6 means near-parity with real advantages on both sides; a 2 means the page cannot yet do the one thing its name promises.

AHEAD

Max Booster's page does more, or does it more credibly, than the competitor's equivalent.

COMPETITIVE

Rough parity — each side has real, distinct advantages.

BEHIND

The competitor's equivalent is more complete, more credible, or working where Max Booster's isn't.

FAILURE MODE

HONESTLY ABSENT

The feature or data genuinely doesn't exist yet, and the product doesn't claim otherwise. A normal, fixable product gap.

FABRICATED / DISHONEST

The product shows a number, label, or "AI" claim as if real or measured — when it is hardcoded, simulated, or not backed by the claimed source. A trust risk, fixed first regardless of score.

Dashboard / Home

/dashboard, /simplified-dashboard

4
/ 10

BEHIND

CURRENT STATE

The full dashboard aggregates the signed-in user's projects, distributed releases, connected-account followers, analytics rows, notifications and countdowns through one comprehensive endpoint; absent data renders as zero/empty states. It also exposes an AI insights panel, but the API response shape and the UI's read of that response don't match, so the panel does not populate. The simplified variant is a materially thinner three-task onboarding checklist, not a lighter version of the same personalization.

CLOSEST COMPETITOR

Chartmetric

Its artist dashboard is the closest public equivalent for cross-platform artist-performance monitoring and actionable music analytics.

WHY CHARTMETRIC WINS HERE

- Artist dashboards consolidate audience, social, playlist and streaming analytics across platforms.
- Documented dashboards support artist tracking and historical performance analysis, not just records entered into one product's own database.

WHERE MAX BOOSTER LEADS

- One home surface links creation, distribution, advertising, projects, release countdowns and onboarding rather than being analytics-only.

WHERE MAX BOOSTER TRAILS

- No demonstrated external DSP/social ingestion on this page, and a response-mapping bug currently prevents the advertised AI score and recommendations from ever rendering.
- Simplified mode is a separate, much thinner onboarding implementation rather than a consistently personalized dashboard.

RECOMMENDED NEXT STEP

Fix the AI-insights response mapping, then connect and label verified DSP/social data sources before displaying performance recommendations.

Projects

/projects

5
/ 10

BEHIND

FABRICATED DATA

CURRENT STATE

This is a signed-in project library backed by real project and Studio CRUD: it creates/opens, edits, duplicates, deletes and plays attached audio, offers royalty-split management, and links into Studio and analytics. It also includes persistent songwriting sessions and an AI-assist request, but when an explicit progress value is absent it displays a hard-coded 10–100% value based solely on workflow stage — as if project completion had actually been measured.

CLOSEST COMPETITOR

BandLab Studio

Its cloud project workspace is the closest public music-production project-management counterpart.

WHY BANDLAB STUDIO WINS HERE

- A browser DAW for recording, editing and producing projects, with projects stored in the user's own account.
- Documented collaboration directly on projects, including inviting collaborators and working on shared tracks.

WHERE MAX BOOSTER LEADS

- Project cards connect royalty splits, distribution-stage metadata and career analytics alongside Studio access.

WHERE MAX BOOSTER TRAILS

- No demonstrated shared-project production from this page, and stage-derived completion percentages are synthetic rather than calculated work progress.
- Audio preview is a basic browser playback path, not a mature cloud-production workflow.

RECOMMENDED NEXT STEP

Replace default stage percentages with an explicit "stage only" label until completion is calculated from persisted checklist/task evidence.

SOURCES: <https://www.bandlab.com/products/studio> · <https://help.bandlab.com/hc/en-us/articles/115002960214-How-do-I-collaborate-on-BandLab>

Collaboration & Workspaces

/workspaces, /collaborations

CURRENT STATE

Workspaces persist creation, email invitations, membership, roles/permissions, audit activity and heartbeat-based presence. Collaborations persists connection requests, suggestions and collaboration-project records, but "Message" only routes to Social Media, and the project-create dialog does not select or invite collaborators.

CLOSEST COMPETITOR

BandLab

It combines a music-creator network with project-level collaboration — the closest public match to these two surfaces together.

WHY BANDLAB WINS HERE

- Documented inviting collaborators into a project and collaborating on tracks directly in Studio.
- A browser-based Studio positioned for creators to make music together without local DAW installation.

WHERE MAX BOOSTER LEADS

- Workspace-level custom roles, auditable activity, invitation email matching, project-share permissions and approval-workflow APIs are broader operational controls than a typical creator collaboration flow.

WHERE MAX BOOSTER TRAILS

- No real-time shared DAW session, track comments/version collaboration, or in-context collaboration messaging is demonstrated — the visible Message control is only a redirect.

RECOMMENDED NEXT STEP

Connect workspace membership to Studio project permissions and add real-time track/comment collaboration before presenting project networking as production collaboration.

SOURCES: <https://help.bandlab.com/hc/en-us/articles/115002960214-How-do-I-collaborate-on-BandLab> · <https://www.bandlab.com/products/studio>

Studio

/studio, /studio/:projectId

6

/ 10

COMPETITIVE

CURRENT STATE

Studio loads a substantial browser DAW with persisted projects/tracks, Web MIDI initialization, timeline/mixer views, recording, comping, automation, a plug-in rack, audio import, stem-export, lyrics, video, versions and a local audio engine. Server-side mix/master routes render real downloadable files with deterministic, role-based processing inferred from track names/types — not model-based mixing — and AI-generation failures return explicit unavailable errors rather than fake success.

CLOSEST COMPETITOR

BandLab Studio

Both are browser-accessible DAWs aimed at recording, arranging and producing music without desktop software.

WHY BANDLAB STUDIO WINS HERE

- A free browser Studio for recording, editing, virtual instruments, effects and production.
- Documented direct project collaboration — a key production-workflow advantage over a single-user DAW surface.
- Documents 370+ built-in virtual instruments plus 50+/40+/20+ vocal, guitar, and bass effect presets.

WHERE MAX BOOSTER LEADS

- Unusually couples DAW projects to royalty splits, distribution and broader artist-business workflows.
- Inspected routes perform a real render/download rather than returning a fake completed mix job.

WHERE MAX BOOSTER TRAILS

- Its "AI" mix/master result is heuristic DSP, and generation availability carries an explicit external-service dependency; no real-time multi-user Studio workflow is demonstrated.
- The competitor documents a much larger, more mature built-in library (370+ instruments, 50+/40+/20+ effect presets) against Studio's actually-processed rack of 10 effect types with no live instrument path. Studio's own 447-entry plug-in browser doesn't close that gap: selecting most of those catalog entries only stores a label in project state without touching the live audio engine.

RECOMMENDED NEXT STEP

Ship synchronized multi-user project editing with track-level comments/version conflict handling, rename heuristic mix/master processing, and stop listing plug-ins the audio engine never actually loads.

SOURCES: <https://www.bandlab.com/products/studio> · <https://help.bandlab.com/hc/en-us/articles/115002960214-How-do-I-collaborate-on-BandLab> · <https://help.bandlab.com/hc/en-us/articles/46380376077593-Using-BandLab-Virtual-Instruments> · <https://help.bandlab.com/hc/en-us/articles/115002945473-Adding-Effects>

Workflow Automations

/workflow-automations

3
/ 10

BEHIND

FABRICATED DATA

CURRENT STATE

The page persists per-user template enablement/configuration and displays execution logs, stats and test-trigger results. The service has 20 predefined music-lifecycle templates and records real notification/email attempts, but several prominent actions are only acknowledgements — upload "analysis" merely queues suggestions, and the mastering "task" is explicitly only a reminder because no tasks table exists.

CLOSEST COMPETITOR

Zapier

The closest public benchmark for user-configurable, event-triggered automation, app actions, error handling and execution history.

WHY ZAPIER WINS HERE

- Exposes thousands of public app integrations and trigger/action workflows rather than a closed set of product-local templates.
- Documented AI-assisted workflow building and automation orchestration across connected tools.

WHERE MAX BOOSTER LEADS

- Templates use music-specific events such as release dates, distribution, playlist placements, PRO registration and beat sales.

WHERE MAX BOOSTER TRAILS

- No public connector ecosystem or arbitrary external workflow builder is demonstrated.
- Several template descriptions promise completed business/analytics/payment actions that the handlers do not actually perform.

RECOMMENDED NEXT STEP

Mark each template's actions as "notify," "queue," or "execute," and implement durable payment-processing and analytics-report actions before enabling those templates by default.

SOURCES: <https://zapier.com/apps> · <https://zapier.com/features/ai-automation>

Assistant

/assistant

2
/ 10

BEHIND

FABRICATED DATA

CURRENT STATE

The chat UI provides quick prompts, pagination and clearing of persistent per-user conversation history, with anonymous use allowed under a tighter rate limit. Despite an "In-House AI" label, replies come from a synchronous fixed knowledge engine rather than a model or API call — stored history is passed to it, but the service is a fixed product-knowledge/intent-response implementation.

CLOSEST COMPETITOR

ChatGPT

The closest public general AI copilot baseline for open-ended conversational help and persistent memory.

WHY CHATGPT WINS HERE

- Positioned for multi-purpose conversational reasoning, writing, analysis and problem-solving rather than a fixed product FAQ corpus.
- Publicly documented user controls for chat memory and saved information.

WHERE MAX BOOSTER LEADS

- Conversation history is directly tied to product navigation and product-specific quick actions.

WHERE MAX BOOSTER TRAILS

- Cannot deliver the open-ended generative/reasoning behavior implied by its AI branding; its visible answers are predetermined knowledge-engine output, not an AI creative copilot.

RECOMMENDED NEXT STEP

Relabel the current feature as a product guide immediately, and only restore AI branding after integrating a model with retrieval over verified user and product data.

SOURCES: <https://openai.com/chatgpt/overview/> · <https://help.openai.com/en/articles/8590148-memory-faq>

A&R Intelligence

/ar-intelligence

3
/ 10

BEHIND

CURRENT STATE

The page requests trend forecast, catalog-gap and release-timing views, but trend forecasting and personalized release timing explicitly return a not-implemented error because performance/audience sources are not connected. Catalog gap analysis is real but limited: it compares published beat genres against a dynamically loaded genre feed, fails loudly if that feed is unavailable, and deliberately omits unsupported opportunity scores.

CLOSEST COMPETITOR

Chartmetric

A direct music-data/A&R intelligence benchmark for artist, playlist, audience and market discovery.

WHY CHARTMETRIC WINS HERE

- Cross-platform artist, playlist, audience and social analytics for music-industry research.
- Documented tracked historical performance data and platform metrics.

RECOMMENDED NEXT STEP

Integrate consented DSP/audience and release-performance data, then launch forecast/timing only with source provenance, sample size and confidence intervals shown beside every recommendation.

WHERE MAX BOOSTER LEADS

- Its catalog-gap endpoint directly compares the user's own published catalog to a live genre feed, rather than requiring a separate analysis workflow.

WHERE MAX BOOSTER TRAILS

- Two of the page's three core intelligence products are deliberately unavailable, and the remaining gap output has no demonstrated demand volume, audience segmentation, playlist intelligence or predictive model.

SOURCES: <https://chartmetric.com/features> · <https://help.chartmetric.com/en/articles/2757803-artist-dashboard>

Beat Marketplace

/marketplace, /marketplace/beat/:id, /marketplace/producer/:id

6

/ 10

BEHIND

CURRENT STATE

Public browsing is backed by real search/filter/pagination; beat and producer pages provide audio previews, follow/like/rating, multi-tier licensing, cart/Stripe Checkout, and a producer profile. The verified Stripe webhook now creates a pending order and books both a revenue event and royalty transactions on completion — the earlier charge-without-booking gap is fixed — though an instant-transfer failure can leave a completed sale for later manual withdrawal. Manually created listings still set the preview equal to the full uploaded audio rather than generating a 30-second clip.

CLOSEST COMPETITOR

BeatStars

A dedicated producer beat marketplace with discovery, licensing, seller stores, and beat-sales checkout.

WHY BEATSTARS WINS HERE

- An established marketplace plus unlimited uploads, marketplace distribution, and seller pages in its plan comparison.
- Customizable license agreements and a documented delivery/licensing workflow for beat sales.
- Detailed beat search/filtering for genre, mood, BPM, key, price, and more.

WHERE MAX BOOSTER LEADS

- Combines marketplace-sale revenue events and collaborator royalty-split ledger entries with the checkout-completion path, rather than treating discovery, sales, and split accounting as wholly separate products.
- Explicitly rejects unsupported escrow checkout rather than presenting it as operational.
- For a basic listing, uses one modal enforcing only title, genre, and an audio file — title can derive from the filename and client-side analysis suggests BPM, key, genre, and mood. This is lower minimum-listing friction than the competitor's fuller publish flow, which also covers visibility, track type, samples, monetization/licenses, and collaborators in the same pass.
- Provides a separate public, seller-configurable storefront (distinct from the producer profile) with custom/subdomain support, logo/banner/avatar, bio and social links, theme colors/fonts/layout, memberships, and promotions — meaningful Pro Page-style branding, though it doesn't establish full feature parity with the competitor's Pro Page.

WHERE MAX BOOSTER TRAILS

- Uploaded listings can expose the full uploaded audio as their preview — a buyer-protection and conversion gap.
- The Stripe completion path spans order completion, transfer, license generation, splits, and revenue recording without one atomic transaction, so payout failure is tolerated after a sale completes.
- The producer profile page itself (as opposed to the separate storefront) is fixed and basic — four stats, no configurable branding, social links, or discography categories — well short of the competitor's customizable seller page.

RECOMMENDED NEXT STEP

Generate and watermark a mandatory 30-second preview on every manual upload, label it in the player, and add a durable reconciliation job that retries any completed sale missing its revenue event, split transaction, or seller transfer.

SOURCES: <https://www.beatstars.com/pricing> · <https://help.beatstars.com/hc/en-us/articles/360037046094-What-is-a-License-Agreement> · <https://help.beatstars.com/hc/en-us/articles/1260802609630-How-Do-I-Upload-Tracks> · <https://help.beatstars.com/hc/en-us/articles/360053638854-How-to-Customize-Your-Pro-Page>

Creator Storefront

/storefront, /storefront/:slug, /store/:slug, /s/:label

CURRENT STATE

The public page renders real storefront/listing/tier/social rows, supports branding, social links, likes/follows/ratings, audio preview, cart, BOGO calculation, and Stripe Checkout; private stores 404 for visitors while owners see a clearly labelled preview. Membership checkout is real Stripe subscription creation and orders are marked complete from the Stripe webhook. The UI displays a view count even though nothing increments it — honestly nonfunctional rather than fabricated, since no fake number is shown.

CLOSEST COMPETITOR

Beacons

A creator-facing hosted link/storefront product centered on a customizable public creator page and direct fan commerce.

WHY BEACONS WINS HERE

- A customizable link-in-bio site with blocks for links, embeds, music, email capture, and other creator content.
- Documented selling of digital products, appointments, and physical products from the creator page.
- Plan-level analytics, custom-domain, email-marketing, and commerce capabilities.

RECOMMENDED NEXT STEP

Implement persistent unique-view/event analytics first, then add configurable link, embed, email-capture, and non-beat product blocks to the existing storefront editor.

WHERE MAX BOOSTER LEADS

- Natively sells beat listings with in-page auditioning, licensing metadata, multi-item cart/BOGO calculations, and creator memberships in one music-specific storefront.
- Owner-only preview and public/private publication behavior are explicit and server-enforced.

WHERE MAX BOOSTER TRAILS

- Limited to the creator's beat listings and membership cards, whereas the competitor's page model supports broader link, embed, email-capture, and content blocks.
- Storefront view analytics are not implemented despite being rendered by the UI.

SOURCES: <https://help.beacons.ai/en/articles/5979493-customizing-your-beacons-page> · <https://help.beacons.ai/en/articles/5952172-how-to-set-up-your-store> · <https://beacons.ai/pricing>

Merch Store

/merch

2
/ 10

BEHIND

CURRENT STATE

This is an authenticated seller-management dashboard only: creators can CRUD physical/digital product records, upload images/downloads, manage variants, inventory and prices, manually update an existing order's tracking/status, and view database-derived statistics. There is no public merch catalog, buyer cart/checkout, payment route, order-creation route, fulfillment integration, or any code path that increments a sold count — the dashboard can only manage orders that were created somewhere else, and nothing in this feature creates them.

CLOSEST COMPETITOR

Fourthwall

Provides creator-branded merch storefronts with product fulfillment and direct fan checkout.

WHY FOURTHWALL WINS HERE

- Storefront creation, product design/catalog tools, checkout, and order fulfillment for creators.
- Handles production, shipping, and customer support for print-on-demand products.
- Publishes seller pricing/fees and payout information rather than positioning the product as only an inventory tracker.

WHERE MAX BOOSTER LEADS

- Basic product-entry controls include seller-defined variants, SKU, sale price, physical inventory, digital-download validation, and tracking-required shipment transitions.

WHERE MAX BOOSTER TRAILS

- Not a commerce channel: no shopper-facing merch experience or checkout/order-creation path exists at all.
- No demonstrated production, shipping-carrier, tax, customer-support, or print-on-demand integration; sales and best-seller analytics cannot become operational from this page alone.

RECOMMENDED NEXT STEP

Build a public merch catalog and Stripe checkout webhook that atomically creates orders, decrements physical stock, increments sold counts, grants digital downloads, and records the paid amount before expanding analytics.

SOURCES: <https://fourthwall.com/features> · <https://fourthwall.com/print-on-demand> · <https://fourthwall.com/pricing>

Invoices

/invoices

3
/ 10

BEHIND

CURRENT STATE

Authenticated users can create validated multi-line-item drafts, choose a currency, set due dates/notes, filter/search their own invoices, email a basic invoice notice, and download a server-generated PDF. Sending only flips a draft to "sent" after the email service succeeds, and returns an explicit failure if delivery fails — but there is no payment page/link, payment collection, automatic paid/overdue transition, reminders, or payment webhook, and tax is hard-coded to zero.

CLOSEST COMPETITOR

Bonsai

A creative-freelancer business platform whose invoicing product combines branded invoices, online payments, automation, and client workflow.

WHY BONSAI WINS HERE

- Invoice templates, recurring invoices, payment reminders, deposits, taxes, and multiple payment options.
- Invoices positioned alongside proposals, contracts, time tracking, and client/project management for freelancers.
- Published plan pricing for the integrated freelancer-business suite.

WHERE MAX BOOSTER LEADS

- Keeps invoice data per user, validates line-item arithmetic and client email, and never marks an invoice sent when email delivery actually failed.

WHERE MAX BOOSTER TRAILS

- No invoice-payment collection or reconciliation, so "paid" is not reachable from the normal invoice workflow.
- No automatic overdue state, reminders, recurring schedules, deposits, taxes, or connected contract/proposal/client workflow.

RECOMMENDED NEXT STEP

Add a Stripe-hosted payment link per sent invoice and webhook-driven idempotent paid/failed/refunded transitions before implementing reminders, recurring billing, and tax calculation.

SOURCES: <https://www.hellobonsai.com/invoicing> · <https://www.hellobonsai.com/features> · <https://www.hellobonsai.com/pricing>

Distribution

/distribution

5
/ 10

BEHIND

CURRENT STATE

Release creation and submission are implemented with metadata, artwork, UPC/ISRC, audio, and platform-selection validation; eligible releases are dispatched through a distribution partner and tracked per platform. Real distribution is contingent on that partner being configured: the guarded service path explicitly fails rather than claiming distribution when the partner API token is unavailable, while unconfigured releases remain local drafts.

CLOSEST COMPETITOR

DistroKid

A self-service digital distributor focused on delivering artist releases to DSPs.

WHY DISTROKID WINS HERE

- Publicly documented distribution to major streaming services and stores.
- Release-level Splits for automatically allocating earnings to collaborators.
- Additional distribution tooling such as instant-gratification and pre-save/release features.

WHERE MAX BOOSTER LEADS

- The release workflow combines validation, draft handling, DDEX package import/export, QC/policy linting, per-platform dispatch records, and protected takedown behavior in one application flow, and fails explicitly rather than silently marking an unconfigured release as distributed.
- Exposes a locally seeded, selectable multi-region DSP/reference catalog well beyond a basic upload form, plus schedule validation, lead-time/countdown guidance, status/retry/SLA tracking, and duplicate-audio fingerprint checks.
- Includes first-party data models and APIs for customizable smart/pre-save pages and several adjacent catalog workflows (artist profiles, sync-license inquiries, playlist pitching, sample clearance, A&R) — real product-surface breadth, though not yet proof of live delivery for any of them.

WHERE MAX BOOSTER TRAILS

- Delivery is dependent on a single distribution-partner integration and environment configuration, whereas the competitor operates an established public distribution service directly.
- Some partner-service methods retain simulated responses when unconfigured — including update, analytics, pre-save, and content-claim paths — and this page's own Content ID route only writes local metadata and a random fingerprint string; neither may ever be represented as live DSP delivery, YouTube/Meta claims, monetization, or payouts.
- The competitor has specific named features this page does not genuinely match: automatic per-release smart pages with live Spotify pre-saves (Max Booster's equivalent exists as a data model, but its UI builder is never actually mounted — the "Create HyperFollow Page" button does nothing), real store pre-orders/Instant Gratification, and functional YouTube Content ID monetization.

RECOMMENDED NEXT STEP

Remove or hard-disable every simulated distribution-partner response in production-facing flows and expose a provider-connection status before users can submit releases.

SOURCES: <https://distrokid.com/features/> · <https://distrokid.com/splits/> · <https://support.distrokid.com/hc/en-us/articles/360013647913-What-is-HyperFollow> · <https://support.distrokid.com/hc/en-us/articles/360013534094-Setting-Up-Pre-Orders-For-Your-Music> · <https://support.distrokid.com/hc/en-us/articles/360013535314-What-is-YouTube-Content-ID>

Royalties

/royalties

4
/ 10

BEHIND

FABRICATED DATA

CURRENT STATE

The page provides a royalty ledger, platform and track aggregates, exports, splits, tax-form records, statements, forecasts, and Stripe Connect onboarding, all derived from persisted transaction and statement rows. Stripe Connect payout requests are real, conditional on configured Stripe and a verified connected account. But Spotify/Apple per-stream rates are blended, admin-editable *estimates* seeded into the system — not ingested DSP settlement data — and some unconfigured distribution-partner royalty methods can return simulated results.

CLOSEST COMPETITOR

DistroKid Splits

The closest public match for release-revenue allocation and collaborator payout management.

WHY DISTROKID SPLITS WINS HERE

- Splits can automatically divide earnings among collaborators.
- Distribution services that connect releases to stores, the prerequisite for store-originated royalty reporting.
- Payment and earnings-related artist tools as part of its distributor offering.

RECOMMENDED NEXT STEP

Replace seeded-rate earnings generation with authenticated DSP/distributor settlement imports that preserve source statements, territory, period, currency, and reconciliation status.

SOURCES: <https://distrokid.com/splits/> · <https://distrokid.com/features/>

WHERE MAX BOOSTER LEADS

- A broad in-app ledger, CSV exports, dispute/tax-form records, payout-risk checks, and Stripe Connect onboarding in addition to split records.
- Split percentages are validated so a release's configured splits cannot exceed 100%.

WHERE MAX BOOSTER TRAILS

- No demonstrated DSP settlement/report ingestion exists; seeded and hard-coded per-stream rates are estimates, so calculated Spotify/Apple earnings cannot be presented as actual remittances.
- Payout-threshold and schedule preferences are stored but nothing automatically drains them, and simulated partner royalty/payout responses remain a production data-integrity risk.

Publishing

/publishing

3
/ 10

BEHIND

CURRENT STATE

The page is a local publishing-rights register for works, writers, publishers, ISWC/ISRC details, PRO selection, and splits; server-side validation requires writer/publisher shares to total exactly 100%. The UI explicitly tells users that records are stored locally and must be submitted directly to their PRO — no PRO registration submission or collection integration is implemented.

CLOSEST COMPETITOR

Songtrust

A public music-publishing administrator whose offering centers on registration and royalty collection across publishing-rights organizations.

WHY SONGTRUST WINS HERE

- Worldwide publishing administration and royalty collection.
- Registering songs with collection societies and other rights organizations.
- A publishing-administration account workflow rather than only a local metadata register.

WHERE MAX BOOSTER LEADS

- Local work and split editing is straightforward, with server-side 100% share validation.

WHERE MAX BOOSTER TRAILS

- Does not submit registrations to PROs, publishers, collection societies, or other rights organizations.
- No demonstrated publishing-royalty collection, matching, claims handling, or administration across territories.

RECOMMENDED NEXT STEP

Integrate a publishing-administration partner or society-registration workflow and show each work's submission, acceptance, and collection status.

SOURCES: <https://www.songtrust.com/how-it-works> · <https://www.songtrust.com/>

Sync Licensing

/sync-licensing

3
/ 10

BEHIND

CURRENT STATE

The page manages a user-owned sync catalog with title, artist, genre, mood, BPM, use cases, pricing, and availability; the server also exposes public browsing and inquiry endpoints. It is not a completed licensing marketplace: BPM filtering is declared but not applied, inquiries do not close a deal, and the generate-license endpoint explicitly returns templated license text as a PDF stub rather than a completed legal-license transaction.

CLOSEST COMPETITOR

Music Gateway

Publicly markets sync-licensing opportunities and licensing services for music creators.

WHY MUSIC GATEWAY WINS HERE

- Sync licensing publicly positioned as a route for music placement in media.
- Positions its offering around connecting music creators with industry opportunities.
- Public information about music licensing and sync-related services rather than only catalog recordkeeping.

WHERE MAX BOOSTER LEADS

- Offers an owned catalog, public discovery route, and inquiry capture directly connected to the artist's workspace.

WHERE MAX BOOSTER TRAILS

- No demonstrated music-supervisor marketplace, rights-clearance workflow, negotiation, deal closing, invoicing, payment, or executed-license process.
- The license-generation path is expressly a stub, and public BPM filtering does not work as declared.

RECOMMENDED NEXT STEP

Build a rights-clearance and transaction workflow that creates versioned licenses only after both parties accept terms, payment is recorded, and all rightsholders are confirmed.

SOURCES: <https://www.musicgateway.com/sync-licensing> · <https://www.musicgateway.com/>

Contracts

/contracts

4

/ 10

BEHIND

CURRENT STATE

The page generates and persists template-based music contracts, creates PDFs, captures a drawn signature image/hash with timestamp and IP, and records contract statuses/timeline events. "Send for signature" only marks a contract ready; the interface and server messaging instruct users to independently verify identity and consent, while the owner can submit a signature for a named party.

CLOSEST COMPETITOR

Dropbox Sign

A public electronic-signature platform providing signer workflows rather than local document and signature recordkeeping.

WHY DROPBOX SIGN WINS HERE

- Electronic-signature workflows for requesting signatures from others.
- Legally binding electronic signatures and associated signing records.
- Published security and compliance information for its signing service.

WHERE MAX BOOSTER LEADS

- Music-specific template categories and variables provide a focused starting point for beat licenses, producer agreements, collaboration documents, and related creator contracts.
- The local document workflow preserves statuses, signature artifacts, hashes, timestamps, and a timeline.

WHERE MAX BOOSTER TRAILS

- No recipient delivery, signer-authentication, recipient signing link, identity verification, or independent e-signature-provider audit trail.
- A contract owner can record a named party's signature, so the stored signature is not evidence of authenticated recipient assent comparable to an e-signature platform.

RECOMMENDED NEXT STEP

Integrate a compliant e-signature provider with recipient-specific signing links, signer authentication, immutable event logs, and completed-document certificates.

SOURCES: <https://sign.dropbox.com/features/electronic-signatures> · <https://sign.dropbox.com/security>

Verification

/verification

CURRENT STATE

The page collects individual or business KYC information and document uploads; the server restricts uploads to JPG, PNG, and PDF at 10MB and stores them via the storage service. Verification remains pending/under review until an administrator approves or rejects it — a real internal manual-review workflow, not automated third-party identity verification.

CLOSEST COMPETITOR

Spotify for Artists

The closest music-platform public comparison because it provides an artist-profile claim and verification pathway tied to artist access.

WHY SPOTIFY FOR ARTISTS WINS HERE

- A public process for claiming an artist profile.
- Claimed artist access enables management of an artist presence and profile tools.
- A public artist-focused access and management platform connected to the listening service.

WHERE MAX BOOSTER LEADS

- Supports both individual and business verification paths, administrative document review, explicit approval/rejection actions, and hardened file-type/size controls.

WHERE MAX BOOSTER TRAILS

- No automated identity-document verification, liveness checks, sanctions screening, or specialized third-party KYC-provider integration.
- The displayed review estimate is a code-derived estimate based on document count, not a service-level commitment or automated verification result.

RECOMMENDED NEXT STEP

Add an identity-verification provider with document-authenticity and liveness checks while preserving the existing manual-review and appeal path for exceptions.

SOURCES: <https://artists.spotify.com/claim> · <https://artists.spotify.com/>

Analytics

/analytics, /analytics/ai

3
/ 10

BEHIND

FABRICATED DATA

CURRENT STATE

The main page aggregates the user's stored analytics rows into daily/weekly/monthly/platform stream and revenue totals; most audience, geography, track, forecast, playlist, and prediction fields are explicitly returned as zero or empty. Its displayed "performance score" is actually a deterministic tally of profile, project, subscription, and security fields — not a measurement of performance. The AI sub-feature always returns an explicit unavailable error rather than generating an insight.

CLOSEST COMPETITOR

Chartmetric

Both aim to centralize music-performance intelligence, but Chartmetric is purpose-built for artist, playlist, audience, and cross-platform music data.

WHY CHARTMETRIC WINS HERE

- Artist, playlist, and platform analytics in one music-data platform.
- Playlist tracking and discovery rather than only user-entered campaign records.
- Published integration/API documentation for programmatic access to its music-data catalog.

WHERE MAX BOOSTER LEADS

- Couples stored streaming/revenue totals with the product's own projects and social workflow in one place.

WHERE MAX BOOSTER TRAILS

- No implemented AI interpretation, and the broad music-intelligence surfaces largely return empty/zero data; the profile-derived "performance score" should not be presented as an analytics measurement.
- No demonstrated DSP/playlist/audience ingestion comparable to the competitor's music-data coverage.

RECOMMENDED NEXT STEP

Replace the profile-based performance score with a clearly labeled account-completeness score and ship authenticated Spotify for Artists/Apple Music ingestion before exposing recommendations or forecasts.

SOURCES: <https://chartmetric.com/platform> · <https://chartmetric.com/playlist> · <https://api.chartmetric.com/docs/>

Social Media

/social-media

4

/ 10

BEHIND

CURRENT STATE

The page persists multi-platform post drafts/schedules and aggregates follower counts plus stored post/autopilot engagement, with OAuth account status and a background sync path. It returns zero/empty data where none exists; direct single and batch calendar publishing explicitly fail until a delivery integration exists. Trending hashtags come from a live feed without invented volume/momentum, and fail loudly if that feed is unavailable.

CLOSEST COMPETITOR

Metricool

Both combine cross-network scheduling, account analytics, and reporting for creators/brands.

WHY METRICOOL WINS HERE

- A unified social-media planner/scheduler across networks.
- Cross-platform social analytics and reporting.
- Plans publicly differentiated by connected brands, users, and analytics/reporting capacity.
- Native in-app ad-campaign creation and management — audience, budget, creative, and publishing — without leaving the product.

WHERE MAX BOOSTER LEADS

- Music-specific AI content, artist context, and Spotify artist lookup are integrated beside social planning.

WHERE MAX BOOSTER TRAILS

- The calendar can store schedules but its direct publish endpoints explicitly cannot deliver them yet — a scheduler's core job.
- No verified equivalent of the competitor's multi-brand/team workflow and report-product depth.
- A built-in ad suite is not a unique Max Booster advantage: both Metricool and Hootsuite document native in-product ad-campaign creation using connected platform ad accounts. Max Booster's own Advertising page still cannot buy or deliver paid ads either way, so this isn't a working differentiator in either direction.

RECOMMENDED NEXT STEP

Implement platform-by-platform delivery workers that mark a post published only after the platform API accepts it, then expose delivery failures and per-network results in the calendar.

SOURCES: <https://metricool.com/social-media-scheduler/> · <https://metricool.com/social-media-analytics/> · <https://metricool.com/pricing/> · <https://metricool.com/ad-campaigns-metricool/> · <https://help.hootsuite.com/s/article/create-fb-ig-ad-campaign>

Advertising

/advertising

2
/ 10

BEHIND

FABRICATED DATA

CURRENT STATE

The page creates campaigns, audience definitions, and uploaded/AI creatives, but can only "activate" a campaign by dispatching organic posts to connected social accounts — spend is always set to zero and the API explicitly states it does not process paid-ad spend. Forecast reach/impressions use fixed budget multipliers and a "confidence" figure based only on campaign count, while ROAS forecasting explicitly reports itself unavailable without validated delivery data.

CLOSEST COMPETITOR

Meta Ads Manager

The closest public equivalent for paid campaign creation, targeting, creative testing, delivery, and outcome measurement.

WHY META ADS MANAGER WINS HERE

- Positioned as the tool to create, manage, and measure campaigns across Meta technologies.
- Documented audience targeting controls, including custom and lookalike audiences.
- Documented reporting/measurement tooling for campaign performance.

WHERE MAX BOOSTER LEADS

- Organic music-promotion post dispatch is coupled to campaign records and AI creative generation in the artist workflow.

WHERE MAX BOOSTER TRAILS

- Neither buys nor delivers paid ads, reports actual spend, nor ingests platform delivery/conversion results — "active" only means organic posts were created.
- Reach/impression forecasts and confidence labels are fixed local estimates rather than validated platform forecasts or observed paid-ad outcomes.

RECOMMENDED NEXT STEP

Remove fixed reach/impression forecasts from production until real ad-platform delivery and insights ingestion can calculate them from actual account, campaign, ad-set, and conversion data.

SOURCES: <https://www.facebook.com/business/tools/ads-manager> · <https://www.facebook.com/business/ads/ad-targeting> · <https://www.facebook.com/business/ads/measurement>

Outreach CRM

/outreach

3
/ 10

BEHIND

CURRENT STATE

This is a per-user, database-backed manual pitch tracker: users create campaigns and contacts, manually advance draft/sent/opened/replied/added statuses, and see counters/follow-up reminders computed from those records. The AI pitch writer calls an external service and fails loudly if it gets no generated text, but the page contains no sending mailbox/inbox, reply ingestion, canned-reply UI, assignment fields, or team-seat workflow — the Inbox icon is only the page header.

CLOSEST COMPETITOR

HubSpot CRM

The closest public match for contact/campaign management, email activity, shared inboxes, templates, and team assignment.

WHY HUBSPOT CRM WINS HERE

- Contact, deal, and activity management in its CRM.
- A shared inbox for team communications and conversation assignment.
- Reusable snippets/templates for sales and service communications.

WHERE MAX BOOSTER LEADS

- Campaign types and the pitch-writing prompt are tailored to playlist curators, blogs, sync, PR, and radio rather than generic sales contacts.

WHERE MAX BOOSTER TRAILS

- No actual inbox exists on this page, so canned inbox replies and real multi-seat team assignment have nothing to attach to yet.
- Sending, open/reply capture, mailbox synchronization, and automation are absent; statuses are user-entered.

RECOMMENDED NEXT STEP

Add a real connected-mailbox conversation model with per-user canned-reply CRUD and assignee membership/permissions before exposing inbox-oriented tasks or claims.

SOURCES: <https://www.hubspot.com/products/crm> · <https://knowledge.hubspot.com/inbox/connect-a-team-email-channel-to-the-conversations-inbox> · <https://knowledge.hubspot.com/snippets/use-snippets>

Playlist Pitching

/playlist-pitching

2
/ 10

BEHIND

CURRENT STATE

The page genuinely persists each user's self-reported pitches, statuses, timestamps, and conversion calculation in the database. Its "Find Curators" directory is a fixed 20-entry constant of names and outbound submission URLs, not a live vetted marketplace or submission integration — clicking "Submit Music" sends the user off-platform.

CLOSEST COMPETITOR

SubmitHub

Both target artist-to-curator playlist pitching, but SubmitHub operates the submission marketplace itself.

WHY SUBMITHUB WINS HERE

- Direct music submissions to curators, bloggers, labels, and influencers.
- Documented response/feedback mechanics from recipients.
- Curator discovery/filtering as part of its submission flow.

WHERE MAX BOOSTER LEADS

- Provides a simple private database for tracking pitches across external submission routes without requiring a marketplace transaction.

WHERE MAX BOOSTER TRAILS

- The directory is static and only redirects to third-party forms — no integrated submission, curator matching, payment/credit flow, feedback, or verified outcome reporting.
- Metrics measure user-entered statuses, not independently confirmed curator decisions or playlist placements.

RECOMMENDED NEXT STEP

Replace the hard-coded directory with a maintained, consented curator catalog that records submission receipts and webhook/email-confirmed responses before calculating placement conversion.

SOURCES: <https://www.submithub.com/how-it-works> · <https://help.submit-hub.com/hc/en-us/articles/360036415333-How-does-SubmitHub-work-for-artists> · <https://help.submit-hub.com/hc/en-us/articles/360036415473-How-do-I-find-the-right-curators>

Press Kit / EPK

/press-kit, /epk/:slug

5
/ 10

BEHIND

CURRENT STATE

The authenticated editor persists artist bio, genres, contacts, social links, rider text and uploaded photos, and can expose a slugged public EPK; the public route returns only public kits and safely proxies selected private-storage photos. "Download PDF" invokes the browser print dialog rather than generating a real PDF, and the public page has no embedded music/video, press clipping, or booking-request workflow.

CLOSEST COMPETITOR

Sonicbids EPK

A purpose-built artist EPK used to present materials to industry opportunities.

WHY SONICBIDS EPK WINS HERE

- An EPK positioned for submitting to gigs, festivals, licensing and industry opportunities.
- Combines the EPK with gig/opportunity submissions rather than only a standalone public profile.

RECOMMENDED NEXT STEP

Add an asset-download bundle and Spotify/YouTube embeds first, then connect the public EPK to a promoter submission/booking-inquiry workflow.

SOURCES: <https://www.sonicbids.com/epk/> · <https://www.sonicbids.com/>

WHERE MAX BOOSTER LEADS

- Public EPKs can serve artist-uploaded private storage through a scoped public-photo route, while retaining a simple custom slug.

WHERE MAX BOOSTER TRAILS

- No opportunity marketplace/submission workflow, media embeds, downloadable asset pack, or actual PDF export.

Fan Hub

/fan-hub

CURRENT STATE

This premium-gated artist CRM stores manually added/imported fans, tags, VIP status, notes and purchase totals; it exports CSV and sends batched email broadcasts through the configured email service. Stats are database aggregates and delivery failure is surfaced honestly rather than reported as sent — but broadcasts are all-subscriber only, and no tracking pixel or unsubscribe mechanism exists, so stored open/click counts are never generated by this route.

CLOSEST COMPETITOR

Fanfix

A creator-focused platform for monetizing and communicating with fans.

WHY FANFIX WINS HERE

- Subscription-based exclusive content and direct fan monetization for creators.
- DM and paid-message monetization as native fan interaction rather than an artist-managed email list alone.

RECOMMENDED NEXT STEP

Implement saved segments plus per-recipient unsubscribe links and an open/click tracking pipeline before adding further broadcast UI.

SOURCES: <https://www.fanfix.io/creators>

WHERE MAX BOOSTER LEADS

- Artists own a searchable, taggable contact list with CSV import/export and can send from their artist identity.

WHERE MAX BOOSTER TRAILS

- No fan-facing hub, gated content/DMs, segmentation, automated journeys, actual engagement tracking, or visible unsubscribe controls.

Fan Memberships

/fan-memberships

CURRENT STATE

Premium artists can create, edit and deactivate monthly or annual storefront tiers, view active Stripe-backed memberships, and see MRR/ARR calculated from stored active subscriptions. A loyalty wallet and leaderboard are persisted, but this page only configures/displays them — it does not itself award credits or manage member content.

CLOSEST COMPETITOR

Patreon

The established creator-membership platform for recurring paid tiers and member benefits.

WHY PATREON WINS HERE

- Paid and free memberships, tier benefits, posts and digital products in a dedicated fan experience.
- Creator tools for community, messaging and analytics around recurring memberships.

RECOMMENDED NEXT STEP

Ship a fan-facing tier page with Stripe checkout, member account management, and benefit-gated posts/downloads tied to each tier.

SOURCES: <https://www.patreon.com/product> · <https://www.patreon.com/product/creator-tools>

WHERE MAX BOOSTER LEADS

- Tier revenue is adjacent to the artist storefront, and the configurable purchase/share/comment credit wallet is a differentiated commerce-loyalty concept.

WHERE MAX BOOSTER TRAILS

- No built-in member-content publishing, community/messaging surface, creator discovery network, or visible member self-service on this page.

Shows / Tour Management

/shows, /show

3
/ 10

BEHIND

FABRICATED DATA

CURRENT STATE

The shows page has real authenticated CRUD for show records, manually recorded attendance/revenue, calendar/list views, and persisted setlists, with aggregate metrics calculated from those stored records. By contrast, "Show Mode" starts from hard-coded track labels, and its play/progress, effects presets and remote-control toggle are pure client-state simulations with no audio playback, effects processing or device-control backend — presented as if they were live.

CLOSEST COMPETITOR

Bandsintown for Artists

A live-event platform centered on publishing tour dates, ticket links and reaching fans around shows.

WHY BANDSINTOWN FOR ARTISTS WINS HERE

- Distributes event listings across its discovery ecosystem and embeds tour dates on artist sites.
- Artist-facing tools to promote shows and notify followers about events.

RECOMMENDED NEXT STEP

Remove the LIVE/remote/effects claims until backed by real playback/device integrations, and prioritize public event publishing with ticket-link and RSVP synchronization.

SOURCES: <https://artists.bandsintown.com/> · <https://artists.bandsintown.com/features>

WHERE MAX BOOSTER LEADS

- Includes internal setlist CRUD and a desktop-oriented live setlist/timer interface alongside manually recorded financial results.

WHERE MAX BOOSTER TRAILS

- No event discovery/distribution, fan RSVP/notification, ticketing sync, routing, or verified ticket-sale ingestion.
- Show Mode presents simulated performance controls as live functionality.

Career Coach

/career-coach

3
/ 10

BEHIND

FABRICATED DATA

CURRENT STATE

The page persists manually created goals and derives insight totals/scores from stored analytics, release, royalty and post records; recommendation generation can use an external AI service but falls back to fixed heuristic patterns when unavailable. Its visible chat actually calls the general product assistant, whose "AI" response is keyword retrieval from a static knowledge base — not a model or genuine analysis of the artist's own data, despite being introduced as an AI coach that analyzes it.

CLOSEST COMPETITOR

A human music-business consultant/manager

There is no like-for-like career-coaching SaaS; this is the realistic alternative for personalized, accountable artist strategy.

WHY A HUMAN MUSIC-BUSINESS CONSULTANT/MANAGER WINS HERE

- Managers' work is described as developing artists' careers and handling the business side of the industry.
- Published professional standards and a code of practice for music managers.

WHERE MAX BOOSTER LEADS

- Goal tracking, stored platform signals and always-available tactical prompts are lower-friction than hiring a manager.

WHERE MAX BOOSTER TRAILS

- Cannot provide accountable judgment, relationships, negotiation or genuinely adaptive chat; static answers are labelled and introduced as an AI career coach that analyzes the artist's data.

RECOMMENDED NEXT STEP

Relabel the current chat as a curated guide until a genuine data-aware Q&A endpoint is live, and show the exact data inputs and heuristic basis for every recommendation.

SOURCES: <https://themmf.net/about/> · <https://aimm.org.uk/code-of-practice/>

Release Countdown

/release-countdown

BEHIND

FABRICATED DATA

CURRENT STATE

Authenticated users can create a persisted dated release countdown; creation automatically inserts a fixed 20-item release checklist, and task completion/progress and countdown time are real database/date calculations. The UI has no control to set artwork or a pre-save URL, creates no public landing page, and the named "AI" checklist generator is actually a deterministic base checklist plus three genre keyword branches — not AI.

CLOSEST COMPETITOR

Feature.fm

Specializes in release landing pages, smart links and pre-save campaigns.

WHY FEATURE.FM WINS HERE

- Pre-save campaigns and smart links that route listeners to their preferred music service.
- Conversion tracking and audience data for music marketing campaigns.

WHERE MAX BOOSTER LEADS

- The built-in artist workspace provides a persisted launch checklist and direct handoff to Fan Hub for release notifications.

WHERE MAX BOOSTER TRAILS

- No hosted fan pre-save page, DSP authorization/capture, smart-link routing, conversion analytics, or editable pre-save/artwork workflow in the UI.

RECOMMENDED NEXT STEP

Build a public DSP pre-save smart-link page that records consented conversions and automatically writes real pre-save/share metrics to the countdown.

SOURCES: <https://feature.fm/features>

Developer API

/developer-api

4
/ 10

BEHIND

CURRENT STATE

The authenticated console creates one-time-view API keys, stores only hashed keys, supports revocation, applies Redis-backed per-key rate limits, and logs actual request usage. The v1 endpoints query the owner's own stored analytics and connected-token presence, but track-level fields explicitly return null for streams/revenue/play/like because those fields are not sourced, and no external music-intelligence dataset is exposed.

CLOSEST COMPETITOR

Chartmetric API

A documented music-intelligence API for programmatic artist, track, playlist and chart data.

WHY CHARTMETRIC API WINS HERE

- A documented REST API for its music analytics data and API access process.
- Cross-platform artist, playlist, audience and chart intelligence rather than only a customer's self-entered/connected data.

RECOMMENDED NEXT STEP

Publish an OpenAPI specification and only expose track-level metrics after wiring them to real analytics sources, while clearly documenting data provenance and refresh cadence.

WHERE MAX BOOSTER LEADS

- Self-service key creation, revocation and per-key first-party usage reporting are available directly in the product UI.

WHERE MAX BOOSTER TRAILS

- Lacks external/global music data, a machine-readable public reference/SDKs and reliable per-track metrics; documented endpoints are a narrow owner-only analytics wrapper.

SOURCES: <https://help.chartmetric.com/en/articles/4821150-chartmetric-api> · <https://chartmetric.com/>

What to fix, in order

P0 — STOP PRESENTING FICTION AS FACT (9 pages)

● Projects

Replace default stage percentages with an explicit "stage only" label until completion is calculated from persisted checklist/task evidence.

● Royalties

Replace seeded-rate earnings generation with authenticated DSP/distributor settlement imports that preserve source statements, territory, period, currency, and reconciliation status.

● Shows / Tour Management

Remove the LIVE/remote/effects claims until backed by real playback/device integrations, and prioritize public event publishing with ticket-link and RSVP synchronization.

● Workflow Automations

Mark each template's actions as "notify," "queue," or "execute," and implement durable payment-processing and analytics-report actions before enabling those templates by default.

● Analytics

Replace the profile-based performance score with a clearly labeled account-completeness score and ship authenticated Spotify for Artists/Apple Music ingestion before exposing recommendations or forecasts.

● Career Coach

Relabel the current chat as a curated guide until a genuine data-aware Q&A endpoint is live, and show the exact data inputs and heuristic basis for every recommendation.

● Assistant

Relabel the current feature as a product guide immediately, and only restore AI branding after integrating a model with retrieval over verified user and product data.

● Advertising

Remove fixed reach/impression forecasts from production until real ad-platform delivery and insights ingestion can calculate them from actual account, campaign, ad-set, and conversion data.

● Release Countdown

Build a public DSP pre-save smart-link page that records consented conversions and automatically writes real pre-save/share metrics to the countdown.

P1 — FIX THE PAGES THAT CAN'T DO THEIR ONE JOB (score 2/10 or below, 4 pages)

● Assistant

Relabel the current feature as a product guide immediately, and only restore AI branding after integrating a model with retrieval over verified user and product data.

● Playlist Pitching

Replace the hard-coded directory with a maintained, consented curator catalog that records submission receipts and webhook/email-confirmed responses before calculating placement conversion.

● Merch Store

Build a public merch catalog and Stripe checkout webhook that atomically creates orders, decrements physical stock, increments sold counts, grants digital downloads, and records the paid amount before expanding analytics.

● Advertising

Remove fixed reach/impression forecasts from production until real ad-platform delivery and insights ingestion can calculate them from actual account, campaign, ad-set, and conversion data.

P2 — PUSH NEAR-PARITY PAGES INTO OUTRIGHT WINS (score = 6/10, 5 pages)

● Collaboration & Workspaces

Connect workspace membership to Studio project permissions and add real-time track/comment collaboration before presenting project networking as production collaboration.

● Creator Storefront

Implement persistent unique-view/event analytics first, then add configurable link, embed, email-capture, and non-beat product blocks to the existing storefront editor.

● Studio

Ship synchronized multi-user project editing with track-level comments/version conflict handling, rename heuristic mix/master processing, and stop listing plug-ins the audio engine never actually loads.

● Fan Memberships

Ship a fan-facing tier page with Stripe checkout, member account management, and benefit-gated posts/downloads tied to each tier.

● Beat Marketplace

Generate and watermark a mandatory 30-second preview on every manual upload, label it in the player, and add a durable reconciliation job that retries any completed sale missing its revenue event, split transaction, or seller transfer.

Defend the breadth. Earn the depth.

Max Booster's pitch to an artist is that they never have to leave for another tool. That pitch only holds if nothing inside the platform quietly lies to them. This snapshot — 29 pages, 1 competitive, 0 outright ahead, 9 flagged for fabricated or dishonest data — is not a verdict on the product's potential; it is a map of exactly where the gap between promise and reality is currently widest.

None of the findings in this report required guesswork: every Max Booster claim traces to a specific route, service, or database query read directly in this codebase, and every competitor claim traces to a public source URL cited on its page. Re-running this same benchmark in two or three months — after the P0 and P1 items are closed — is the fastest way to confirm the gap is actually narrowing.

Every competitor claim, cited
